

NeoShell — Zero-Config Neovim IDE

NeoShell is a lightweight, developer-first IDE built around Neovim — designed to eliminate terminal friction and configuration overhead.

Open NeoShell → Resume your project instantly → No setup, no terminal.

Why NeoShell?

Neovim is incredibly powerful, but often requires heavy customization, constant terminal context-switching (`cd + nvim`), and lacks a unified project-level UX out of the box.

NeoShell solves this by providing:

-  **Project Manager:** GUI dashboard to switch between workspaces instantly.
 -  **Session Intelligence:** Auto-save and exact restoration of open files, window splits, and cursor positions.
 -  **Embedded Editor:** Runs a fully native Neovim instance (`nvim --embed`) controlled via RPC.
 -  **Command Engine:** Run project-specific scripts (Build, Test, Run) effortlessly.
-

How it Works

NeoShell uses the **DevTrace Engine** beneath the surface. DevTrace logs editor events and API usage, allowing for deep intelligence, state reconstruction, and observability.

For a deep dive into the underlying architecture, event sourcing design, and the DevTrace backend:

Getting Started (Planned)

```
git clone https://github.com/pd241008/neoshell
cd neoshell
npm install
cargo run
```

Target MVP Scope

Phase 1 focus ensures a fast time-to-market with these crucial capabilities:

-  Basic GUI shell using Tauri
-  Launch and embed an instance of Neovim via RPC
-  Basic Project Dashboard to open folders
-  Automatic state memory for the current session

(For the complete technical roadmap, refer to the Design Doc).
