

▣ NeoUI: High-Performance Brutalist Design System

NeoUI is a "shadcn-inspired" component library designed for the modern web. It combines a high-performance **Rust-based CLI** with a premium, high-contrast **React component library**.

▣ Features

- ⚡ **Lightning Fast CLI:** Built in Rust for zero-overhead component injection.
- ▣ **Neo-Brutalist Aesthetic:** High-contrast, sharp-edged, and vibrant design tokens.
- ▣ **Fully Accessible:** Built on top of Radix UI primitives with ARIA compliance.
- • **Dark Mode Ready:** Optimized for high-impact pure black dark modes.
- ▣ **Production Ready:** Complete Storybook documentation and Vitest Browser test suites.

▣ Architecture

NeoUI is structured as a modular ecosystem:

- `/cli` : The Rust core responsible for `init` and `add <component>` commands.
- `/packages/registry` : Source templates for all Neo components.
- `/web` : Documentation and visual playground.

▣ Getting Started

1. Initialize NeoUI

Bootstrap your project with the Neo design system (colors, shadows, and base utilities).

```
npx @pd241008/neoui init
```

2. Add Components

Inject components directly into your codebase.

```
npx @pd241008/neoui add button
npx @pd241008/neoui add card
npx @pd241008/neoui add badge
npx @pd241008/neoui add tabs
```

3. Theme Orchestration

NeoUI comes with built-in theme support.

```
npx @pd241008/neoui add theme-provider
npx @pd241008/neoui add theme-toggle
```

▨ Testing

We believe in high-fidelity testing. Every component is verified using:

- **Storybook:** Visual isolation and variant documentation.
- **Vitest Browser:** Real-world browser interaction tests via Playwright.

```
# Run visual playground
npm run storybook

# Run browser tests
npm exec vitest run
```

▨ Project Roadmap

- ☒ **Phase 1:** Brutalist Design System Foundations.
- ☒ **Phase 2:** Rust CLI Scripts & Component Frontend Scaffold.
- ☒ **Phase 3:** Component Library Completion.
- ☒ **Phase 4:** Documentation & Release.
